MPM RODENT ENTRY POINT CHECKLIST

info@madsenpest.com | 715-791-4777 | MadsenPest.com | 24550 WI-35 #70, Siren, WI 54872

Potential rodent entry points to check around your property.
Check off each area as you complete your inspection!

- [ ] **1. Garage Door Seals**

  Take a look at the bottom and sides of your garage doors. Worn weather stripping, damaged seals, or uneven surfaces can leave gaps that give rodents an opportunity to sneak inside.

- [ ] **2. Utility Openings**

  Pipes, electrical wiring, cable lines, and other utilities often pass through exterior walls. Check around these areas for gaps or openings that may provide access to your home or building.

- [ ] **3. Window Seals & Frames**

  Take a closer look around your windows! Worn weather stripping, cracked caulking, and gaps around window frames can give rodents an opportunity to sneak inside. Don't forget those basement windows!

- [ ] **4. Foundation & Exterior Walls**

  Even the smallest cracks can cause big problems! Check your foundation for cracks, gaps where siding meets concrete, and other openings that could give rodents a way inside.

- [ ] **5. Exterior Vents**

  Dryer vents, exhaust vents, and other exterior openings can be vulnerable when protective covers are damaged or missing. Make sure vents are properly protected without restricting their intended airflow.

- [ ] **6. Rooflines & Soffits**

  Don't forget to look up! Gaps along rooflines, damaged soffits, and openings near fascia boards can provide access to attics and other protected spaces. Squirrels and other wildlife may also take advantage of these areas.

Found something suspicious? Avoid sealing an opening if an animal may still be inside. MPM can help identify potential entry points, address existing rodent activity, and perform exclusion work to help prevent rodents from finding their way back inside.
